

BAHI

The udhaar book both sides can see.

The customer scans the shop's udhaar QR, or asks for udhaar on her own phone. The shopkeeper tells his AI munshi the amount, and nothing is written until both sides say yes. Every night, plain code decides who actually needs a reminder.

Paytm Build for India AI Hackathon · Mumbai, 3 October 2026

Track 2: AI-Powered Financial Journeys

Team Hustlers

Shopkeeper · Customer · our working app, demo data

The udhaar book has one author. The customer never sees it.

He can't see patterns

Someone who always pays on day 9 and someone quietly drifting away look the same in a notebook. So everyone is chased the same way.

The customer has no record

He can't see what he owes across shops. If the book says ₹500 and he remembers ₹300, he has nothing to show.

Apps went digital on one side only

Khatabook alone has 5 Cr+ downloads. Its customers still get only an SMS — no app of their own, and no say in the entry.

One entry, agreed by both sides, inside the Paytm they already use.

1 She scans, and can ask

A separate udhaar QR. She may say how much, and what for.

2 The shop says yes

Or says the amount to the munshi. Nothing is written before his yes.

3 In both books

Her ask was her yes. Otherwise: "Yes, I owe ₹200" on her phone.

4 A chat like a passbook

Every udhaar and payment shows the total before and after it.

5 Code picks who hears

Only people past their own longest gap. Everyone else is held, with why.

An AI munshi that does the work, and never writes without a yes.

What it does

- Talk or type, in Hindi, English, Marathi or a mix. Sarvam hears any of them.
- Finds the customer by the sound of a name, or how the shop describes them.
- Asks before reading names; then says only the names.
- Puts every change on a card: an entry, a payment, a correction, taking one back, new details, a message. Only his yes writes it.
- Paytm Assistant: ask anything about the book. The chat is kept.

Its tools are our code

find_customer · counter · customer_card · propose_entry · propose_correction ·
propose_removal · propose_details · propose_message · remember · recall ·
expected_payments · tonight

Everything here runs in our app today.

Two ways in

The shop says the amount, or the customer asks on her phone. Both agree before it counts.

Agreed totals

What someone owes is what they said yes to. Waiting and questioned amounts are shown apart.

Mistakes fixed in the open

“Not mine” or “Wrong amount”; the shop corrects or takes it back, the old entry struck through.

Passbook chat

Each udhaar and payment card shows the total before and after: ₹80 → ₹180 → ₹100.

Reminders with reasons

Rewrite one, move its hour, stop it, or pause someone for a week, two or a month.

Memory

Notes, promises in chat and nicknames. A promise holds a reminder; it never sends one.

Soundbox

Chimes, and says amounts aloud: “दो सौ रुपये का उधार था, उसमें से सौ मिले”. Never a name.

Every shop, one view

The customer sees what she owes across every shop, and pays by UPI, all or part.

Any language

Sarvam hears the language spoken; the munshi answers in it, in its own script.

AI understands the words. Plain code decides every number.

DURING THE DAY — RECORDING AN ENTRY

EVERY NIGHT — DECIDING WHO HEARS FROM US

How we prove it: a test fails the build if the core logic imports anything outside Python's standard library. The model only ever returns words.

Every udhaar app serves the shopkeeper. We add the customer.

	DOWNLOADS	CUSTOMER HAS AN APP	CUSTOMER CONFIRMS ENTRIES
Khatabook	5 Cr+	No — SMS / WhatsApp	No
OkCredit	1 Cr+	No — “They don’t need the app”	No
Paytm Business Khata	Inside Paytm for Business	No — SMS with a pay link	No
Done	100+	Yes	Yes — by OTP
BAHI	—	Yes — inside the Paytm app	Yes — one tap

Two-sided

An entry becomes a fact only when the customer confirms it.

Scan, then speak

The QR says who, his voice says how much. Nothing to type.

Timed per person

Reminders follow each customer’s own repayment pattern.

Fewer reminders, sent only to people who are actually late.

4 of 38

customers who owe get a reminder tonight.

The other 34 are not late by their own pattern, so they hear nothing.

Our demo shop: 60 customers, six months of synthetic data.

For the shopkeeper

Stops chasing people who always pay.

Spots the ones who are drifting.

Records by voice, so the queue keeps moving.

For the customer

Sees his total across every shop.

Has proof of every entry.

Is reminded privately, not at the counter.

For Paytm

Udhaar settled in cash moves to UPI.

A daily reason to use the Soundbox.

A new reason to open the Paytm app.

Free for both sides. Paytm gains through the Soundbox.

1.57 Cr

storefronts already run a Paytm Soundbox — the counter BAHU lives on.

Source: Paytm Q1 FY27 earnings release, Jul 2026

What Paytm gets

- Udhaar repayments move from cash to Paytm UPI.
- A reason for merchants to keep their Soundbox subscription.
- Later, with consent: a repayment history for people with no credit file. We only record it — licensed partners would lend.

₹116 Cr

Khatabook's FY24 loss, on ₹102.7 Cr revenue. Charging for a ledger has not worked, so we don't.

Source: YourStory, Nov 2024

Four things BAHF refuses to do, each from Indian law.

1

No due dates

Customers tap “Yes, I owe ₹200” — never “I’ll pay by the 10th”.

Why: A dated promise can be a promissory note, which the IT Act does not cover.

IT Act 2000, s.1(4) & First Schedule

2

No fees, no interest

Never a rupee above the price. There is no fee field anywhere.

Why: Money-lending laws define a loan by the interest it carries.

e.g. Karnataka Money Lenders Act 1961, s.2(9)

3

No debt kept alive forever

We never ask a customer to re-confirm an old debt just to keep it alive.

Why: Each written acknowledgment restarts the 3-year limit.

Limitation Act 1963, s.18

4

No shaming, no pressure

No defaulter lists, no public alerts, no “demand” button.

Why: Public labels risk defamation; repeated nudges for gain are “nagging”.

BNS 2023, s.356 · CCPA Dark Patterns Guidelines 2023

Tested on 1,338 recordings, and running end to end.

2.1%

of spoken entries would have reached a phone wrong, and that one still needs the customer's own yes.

73.4% right from the words alone

16.9% one tap to pick who

7.6% said again

1,338 recordings: 42 lines, 12 voices, quiet, street noise and a second customer talking; 20 customers named Anubhav.

Tested

367 API tests: the schema's rules on real Postgres, the arithmetic with no database.

32 web tests: no amount typed into a screen, no shaming words, one palette.

An agent eval: another model plays the shopkeeper with a hidden goal.

Running

Next.js on Vercel, the API on Render, the ledger on Supabase, all in Singapore.

Row level security on every table: only our API reads the book.

Demo data is synthetic and labelled. The Paytm account lookup and the UPI PIN are simulated.

Code: github.com/Uchiha-Itachi0/PAYTM-BAHI
